Men and Women’s Brains and the way they communicate

Mikala Miller
South Mountain Community College

Introduction

Men and women's brains are vastly different in the way they think and communicate. This is true for the way people speak and process information. Although it is important to remember generalizations and the fact that they are not always 100 percent accurate, data from research studies shows patterns in both communication and behavior styles. Understanding the way both genders communicate can allow for better interpersonal connections between humans.

Survey Q’s

Gender you most closely identify with
Men/Women
Q1 Do you think that men and women's brains process data differently?
Yes/No
Q2 Who responds to stressful situations in a logical manner?
